CASE STUDY

Compliance QA Simulation Tool

Type: Client Project

Domain: RegTech · AI Prototyping

Status: Built & Delivered

Client Project | RegTech · AI Prototyping | Product Portfolio | Compliance

Type: Client Project | **Domain:** RegTech · AI Prototyping | **Status:** 🟢 Built & Delivered

The Challenge

Before committing engineering resources to a full-stack compliance scanning platform, the client needed to validate the concept with internal stakeholders. The question: **can we get buy-in and useful feedback before writing a single line of production code?**

The answer was a zero-dependency browser prototype that simulated the complete user experience — enough for real users to interact with, form opinions about, and provide actionable feedback.

What I Built

A fully functional simulation built in **vanilla HTML/CSS/JS using vibe coding** — no frameworks, no backend, no dependencies. Runs entirely in the browser.

Components:

COMPONENT	WHAT IT DOES
Dashboard	Overview of compliance scan status, pending reviews, violation count
Checklist Builder	Drag-and-drop interface to configure which rules to apply per asset type
Progress Animation	Visual compliance scanning animation simulating AI processing
Audit Log	Timestamped record of all compliance decisions for regulatory evidence

Why This Approach

The build-before-validating trap: Many products fail because teams spend months building something before showing it to stakeholders. By the time feedback arrives, the cost of change is high.

The prototype strategy: A browser-based simulation costs days, not months. Stakeholders interact with something that looks and feels real — and give feedback on the actual experience, not on a slide deck description of it.

The constraint as an advantage: Zero dependencies meant the prototype could be shared as a single HTML file, opened in any browser, with no setup. Stakeholder feedback sessions required no technical setup.

Outcome

- Prototype used in 3 stakeholder feedback sessions
- Checklist builder UI was redesigned based on direct feedback before full-stack build began
- Audit log feature was added to scope based on prototype session — stakeholders identified regulatory evidence as a higher priority than originally scoped

- Stakeholder confidence score: high enough to greenlight full-stack investment

Key Learning

> *A prototype is a risk-reduction tool, not a shortcut. The goal isn't to avoid building — it's to make sure you build the right thing.*
